

BeautiFill Balance

Our volume changes as we age. Often, we end up with a little too much volume in some places—and not enough in others.

BeautiFill™ moves fat cells from one place to another, restoring balance. BeautiFill uses safe, effective laser energy to gently transfer fat cells from places you don't want it, then uses it to fill the areas where extra volume is needed. Reduce volume to restore volume in one simple, in-office procedure. BeautiFill is the natural alternative to synthetic materials — with longer-lasting results!

BeautiFill Option

Discover how you can use your own volume to restore volume and recontour in more areas than one in one simple in-office procedure.

HOW DOES BEAUTIFILL WORK?

The BeautiFill procedure uses laser energy under the skin to gently loosen fat from problem areas such as the abdomen, hips, flanks, and thighs. The live harvested fat cells are then injected into areas where volume has been lost, including many facial areas and certain areas of the body such as the buttocks.

WHAT MAKES BEAUTIFILL UNIQUE?

The crucial difference between BeautiFill and other fat transfer methods is how the fat is harvested. Other fat harvesting methods were intended to destroy and/or discard fat, not preserve it for reimplantation. BeautiFill uses a proprietary laser instrument designed to extract the highest quantity and quality of live fat cells for reimplantation. In a clinical study, the fat harvested patients reported greater than 90% fat cell viability. The higher percentage of live cells, the higher chance for cell survival following reimplantation.

HOW MANY TREATMENTS IS REQUIRED?

The transfer of fat cells can be performed in one treatment, and you can expect to see an immediate difference right away. And most patients will see the improvement last for years.

IS THE PROCEDURE PAINFUL?

No. BeautiFill is an outpatient procedure performed completely awake and under local anesthetics which avoids risks traditionally associated with general anesthesia. In addition, BeautiFill's laser energy provides the added benefit of less bruising and swelling often seen with other fat harvesting methods.

WILL I NEED TO TAKE TIME OFF AFTER THE PROCEDURE?

This depends on the amount of volume you seek to remove and restore. For smaller cases, such as full-face volumization, patients may experience a mild degree of swelling, bruising and soreness for 24-48 hours, none of which should prevent you from resuming daily activities the next day if desired.
